8/4/26

Experiment - 1

Aim

Create a new Process by invoking system call. Get the process identifier of the currently running process and its respective parent using system calls and display the same using C Program.

Algorithm

* Include necessary headers: Include necessary header files like <stdio.h> and <unistd.h> for using system calls.

* Declare variables: Declare variables to hold the Process ID (Pid_t - Pid) and Parent process ID (Pid_t pid)

* Get the current Process ID: Use the getpid () system call to retrieve the parent process ID.

* Get the Parent Process ID: Use the getppid() system call to retrieve the parent process ID.

* Display the process IDs: Print process IDs to Console.

* Create new process: Use fork() system call to create new process. Check the return value of fork to determine wheather the process is running in parent or child process

* Display Process ID in child and parent processes. Depending on the process, display the respective ID.

Result

The Program successfully created a new process using fork () and displayed the Process ID (PID) and Parent Process ID (PPID).
