Experiment - 2

Aim

Design a CPU scheduling Program with C using FCFS technique with following consideration

Algorithm

* Include necessary headers
* Include necessary header files like <Stdio.h> for I/O operations.
* Define the Process structure
* Define a structure to hold the process information, such as Process ID, arrival time, burst time, waiting time and turn around time.
* Input the number of Process information and their details: Input the numbers of Processes and their arrival time and burst tim
* Sort Processes by arrival time (if not giv If the Process are not already sorted by arrival time, sort them based 7. Calculate waiting time and turnaround time.

Result

This document outlines an algorithm for a C program to implement (FCFS) CPU scheduling by arrival times.
