Experiment - 4

Aim

Construct a scheduling Program with C that selects the waiting process with the smallest execution time to execute next.

Algorithm

* Include necessary header: Include the necessary header files like <Stdio.h> for I/O Operations.
* Define the process structure
* Define a structure to hold the process information, such as process ID, arrival time, burst time, waiting time and turnaround time.
* Input the number of process and details Input the number of processes and their arrival time and burst time.
* Sort Process by burst time: Sort the processes based on burst time in ascending order
* Calculate waiting time and turnaround time calculate for each process based on SJF scheduling algorithm.
* Display Scheduling information: Display the process details including process ID arrival time, burttime, waiting time and turn around time.

Result

This experiment outlines an algorithm for a SJF scheduling Program, detailing steps to sort processes by the small execution time and calculate their waiting and turnaround times.
